Ashish Regmi

Senior Software Engineer

Waterloo, Ontario, Canada | ashish.regmi@zkward.com | ashishregmi.ca | linkedin.com/in/ashish-regmi | github.com/mrarejimmyz

PROFESSIONAL SUMMARY

Software engineer based in Waterloo, Ontario. Currently Lead Developer at ZKward, where I build and run AI agents in production. Previously a Senior Software Developer at Revolent Group on an enterprise client placement at Manulife, with freelance software projects before that role. Earlier in my career I worked in technical operations at Shaw Communications and frontend development at GamerLink, so I am comfortable both building software and working with the people who use it. What has never changed is how I work: I am a builder who learns new stacks by shipping in them. Five hackathon wins and grants across ecosystems I picked up for the event itself (Worldcoin, Starknet, Filecoin, Internet Computer), on top of production work from React front ends to Move smart contracts. Available to start immediately.

TECHNICAL SKILLS

Programming: Python, TypeScript, JavaScript, Node.js, Move
Engineering practices: Remote diagnostics and troubleshooting, end-user training, QA and test planning, clear technical documentation, stakeholder communication
Backend & systems: Backend architecture, serverless integrations, external system integration, resilient infrastructure, Cloudflare DNS
AI systems: Local LLMs, AI agents, tool calling, multi-agent orchestration, autonomous verification, risk monitoring

PROFESSIONAL EXPERIENCE

Lead Developer | ZKward

September 2025 – Present | Waterloo, Ontario

- Lead development of a production multi-agent AI platform: six specialized agents run an autonomous USDC vault live on Sui mainnet since June 2026, with every agent action recorded on-chain for full auditability.
- Designed the verify-before-execute architecture: an independent verification agent validates each proposed action before execution, and tool permissions are scoped per agent, so invalid or out-of-policy actions stop before they touch user funds.
- Built the evaluation harness that gates every release on regression tests across agent behaviors, plus the observability and risk monitoring that keep the live system inspectable.
- Wrote and optimized secure Move smart contracts for vault operations: transaction safety, low gas overhead, and external data-feed integration.

Senior Software Developer | Revolent Group

January 2022 – August 2025 | Client placement at Manulife, Toronto

- Built enterprise backend systems across a 3.5-year client placement at Manulife: workflow automation, approval processes, data models, validation rules, reports, and dashboards used daily by business teams.
- Kept 90%+ automated test coverage on backend code while shipping integrations with external platforms over REST APIs.
- Led data migrations across environments, with cleansing, reconciliation, and validation completed before go-live.
- Implemented role-based access controls and permission models for platform governance, and translated stakeholder requirements into shipped, documented systems.

Technical Operator | Shaw Communications

March 2019 – August 2020

- Automated diagnostic routines across 1.5 years of technical operations so a customer-requested soft refresh executed instantly instead of through manual steps.
- Diagnosed and resolved network and service issues remotely using Netcracker diagnostic tools, tracking cases in CRM from report to resolution with clear escalation documentation.

Software Developer | Freelance

September 2020 – December 2021 | Waterloo, Ontario

- Built and maintained client web applications and backend services with Python, Node.js, and React, scoping each engagement directly with clients from requirements to delivery.

Frontend Developer | GamerLink

January 2018 – December 2018

- Developed frontend features with React and React Native for a gaming platform, and contributed to UI and product design.

SELECTED PROJECTS

ParManusAI: Local LLM Agent Framework (Python, LLM agents, tool calling)

Built an open-source framework for running local large language model agents with high-speed execution and advanced tool calling, designed so agent behavior stays testable and repeatable.

Multi-Agent Verification Systems (Python, multi-agent orchestration)

Built multi-agent systems that split tasks across agents and verify each other's work before anything is finalized. The hard problem solved is trust: no agent output ships unchecked.

HACKATHON WINS & GRANTS

- Best Sign in with Worldcoin App, ETHGlobal Waterloo 2023 (P2PLend)
- Triple winner, StarkHack 2024: Herodotus Best Use of Storage Proof API, Voyager API Prize, Dynamic Pool Prize (Sunya)
- Filecoin Privacy Tools winner, HackFS 2024 (HimalayaZkBarrier)
- Starknet Foundation Seed Grant recipient (Project Sunya)
- 3rd Place, Canada Funnel, WCHL25 Qualification Round (AVAI Agent)

EDUCATION

Conestoga College

Computer Application Security, 2018

Dean's List: A and A+ grades throughout the program.

Sharda University

Bachelor's, Computer Science, 2012–2016

WORKING STRENGTHS

Comfortable moving between writing code, testing it, and working with the people who use it. I document my work, keep data accurate, and learn new tools quickly.
